

## SC3046B-5

### 933.12 MHz Differential Sine-Wave Clock

SMC-8B Case

- Quartz SAW Frequency Stability
- Fundamental Fixed Frequency
- Very Low Jitter and Power Consumption
- Rugged, Miniature, Surface-Mount Case
- Low-Voltage Power Supply (3.3 VDC)

This digital clock is designed for use in high-speed communications timing systems. Fundamental-mode oscillation is made possible by surface-acoustic-wave (SAW) technology. The design results in low jitter, compact size, and low power consumption. Differential outputs provide a sine wave that is capable of driving 50  $\Omega$  loads.

#### Absolute Maximum Ratings

Rating	Value	Units
Power Supply Voltage ( $V_{CC}$ at Terminal 1)	0 to +4.0	VDC
Input Voltage (ENABLE at Terminal 8)	0 to +4.0	VDC
Case Temperature (Powered or Storage)	-40 to +85	$^{\circ}\text{C}$

#### NOTES:

- Unless otherwise noted, all specifications are at  $25 \pm 3^{\circ}\text{C}$  and include any combination of load VSWR and VCC. In addition, Q and Q are terminated into 50  $\Omega$  loads to ground. (See: Typical Test Circuit.)
- One or more of the following United States patents apply: 4,616,197; 4,670,681; 4,760,352.
- The design, manufacturing process, and specifications of this device are subject to change without notice.
- Only under the nominal conditions of 50  $\Omega$  load impedance with VSWR  $\leq$  1.2 and nominal power supply voltage.
- Symmetry is defined as the pulse width (in percent of total period) measured at the 50% points of Q or  $\bar{Q}$ . (See: Timing Definitions.)
- Jitter and other spurious outputs induced by externally generated electrical noise on  $V_{CC}$  or mechanical vibration are not included. Dedicated external voltage regulation and careful PCB layout are recommended for optimum performance.
- Applies to period jitter of Q and  $\bar{Q}$ . Measurements are made with the Tektronix CSA803 signal analyzer with at least 1000 samples.
- Period jitter measured with a 200 mV $_{P-P}$  sine wave swept from 1 MHz to one-half of  $f_O$  at the  $V_{CC}$  power supply terminal.
- The outputs are enabled when Terminal 8 is at logic HIGH. Propagation delay is defined as the time from the 50% point on the rising edge of ENABLE to the 90% point on the rising edge of the output amplitude or as the fall time from the 50% point to the 10% point. (SEE: Timing Definitions.)
- The start up time is defined as the time from when power is applied to terminals 1 and 8 (90% of 3.3V) until power out from Q and Qbar reaches 90% of Qout level.

## Case Design

All pads consist of 30 microinches (min) electroless gold on 50 microinches (min) electroless nickel over base metal. The metallic center pad was designed for mechanical support. Grounding of this pad is critical to the performance of this high frequency Clock.

Lid symbolization, including terminal 1 locator dot, are in contrasting ink. Symbolization varies by model number. For purposes of illustration, only terminal 1 dot is shown.
