

RFM products are now Murata products.

## **OP4017B**

- Quartz SAW Stabilized Differential Output Technology
- Very Low Jitter Fundamental-Mode Operation at 777.60 MHz
- Voltage Tunable for Phase Locked Loop Applications
- Optical Timing Reference for Forward Error Correction Applications

The OP4017B is a voltage-controlled SAW clock (VCSC) designed for phase-locked loop (PLL) applications in optical data communications systems. The differential outputs of the OP4017B are generated by high-Q, fundamental mode quartz surface acoustic wave (SAW) technology. This technique provides very low output jitter and phase noise, plus excellent immunity to power supply noise. The OP4017B differential outputs feature ±1% symmetry, and can be DC-configured to drive a wide range of high-speed logic families. The OP4017B is packaged in a hermetic metal-ceramic LCC.

### **Absolute Maximum Ratings**

| Rating           | Value      | Units |
|------------------|------------|-------|
| DC Suppy Voltage | 0 to 5.5   | Vdc   |
| Tune Voltage     | 0 to 5.5   | Vdc   |
| Case Temperature | -55 to 100 | °C    |

CAUTION: Electrostatic Sensitive Device. Observe precautions for handling. COCOM CAUTION: Approval by the U.S. Department of Commerce is required prior to export of this device.

- Unless otherwise noted, all specifications include the combined effects of load VSWR, V<sub>CC</sub> and T<sub>C</sub>.
- Net tuning range after tuning out the effects of initial manufacturing tolerances, VSWR pushing/pulling, V<sub>CC</sub>, T<sub>C</sub> and aging.
- The internal design, manufacturing processes, and specifications of this device are subject to change without notice. Specified only for a balanced load with a VSWR < 1.2 (50 ohms each side), and a V<sub>CC</sub> = 3.0 Vdc.
- Symmetry is defined as the width in (% of total period) measure at 50% of the peak-to-peak voltage of either output.

  Jitter and other noise outputs due to power supply noise or mechanical vibration are not included in this specification except where noted. Applies to period jitter of either differential output. Measured with a Tektronix CSA803 signal analyzer with at least 1000 samples.
- One or more of the following United States patents apply: 4, 616,197; 4,670,681; 4,760,352.

### **Typical Printed Circuit Board Land Pattern**

A typical land pattern for a circuit board is shown on the right. Grounding of the metallic center pad is optional.

Typically 0.01" to 0.05" or 0.25 mm to 1.25 mm (8 Places)

(The optimum value of this dimension is dependent on the PCB assembly process employed.)
