

RoHS Compliance
This component is compliant
with RoHS directive.
This component was always
RoHS compliant from the first
date of manufacture.

RO3073E-14

315.00 MHz SAW Resonator

Ideal for 315 MHz Automotive-Keyless-Entry Transmitters

- Very Low Series Resistance
- · Quartz Stability

The RO3073E-14 is a true one-port, surface-acoustic-wave (SAW) resonator in a surface-mount, ceramic case. It provides reliable, fundamental-mode, quartz frequency stabilization of fixed-frequency transmitters operating at approximately 315.00 MHz. This SAW is designed for automotive keyless-entry applications operating in the USA under FCC Part 15, in Canada under IC RSS-210, and in Italy.

Absolute Maximum Ratings

| Lid Symbolization | | 908 // YWWS | | | | | |
| StandardReelQuantity | Reel Size 13 Inch | | 10 | 4000 Pieces / Reel | | | |

CAUTION: Electrostatic Sensitive Device. Observe precautions for handling. Notes:

- Frequency aging is the change in f_C with time and is specified at +65°C or less. Aging may exceed the specification for prolonged temperatures above +65°C. Typically, aging is greatest the first year after manufacture, decreasing in subsequent years
- decreasing in subsequent years.

 2. The center frequency, f_C , is measured at the minimum insertion loss point, IL_{MIN} , with the resonator in the 50 Ω test system (VSWR \leq 1.2:1). The shunt inductance, L_{TEST} , is tuned for parallel resonance with C_O at f_C . Typically, $f_{OSCILLATOR}$ or $f_{TRANSMITTER}$ is approximately equal to the resonator f_C .
- One or more of the following United States patents apply: 4,454,488 and 4,616,197.
- Typically, equipment utilizing this device requires emissions testing and government approval, which is the responsibility of the equipment manufacturer.
- 5. Unless noted otherwise, case temperature $T_C = +25^{\circ}C \pm 2^{\circ}C$.
- The design, manufacturing process, and specifications of this device are subject to change without notice.

- Derived mathematically from one or more of the following directly measured parameters: f_C, IL, 3 dB bandwidth, f_C versus T_C, and C_O.
 Turnover temperature, T_O, is the temperature of maximum (or turnover)
- Turnover temperature, T_O, is the temperature of maximum (or turnover) frequency, f_O. The nominal frequency at any case temperature, T_C, may be calculated from: f = f_O [1 FTC (T_O -T_C)²]. Typically oscillator T_O is approximately equal to the specified resonator T_O.
- 9. This equivalent RLC model approximates resonator performance near the resonant frequency and is provided for reference only. The capacitance C_O is the static (nonmotional) capacitance between the two terminals measured at low frequency (10 MHz) with a capacitance meter. The measurement includes parasitic capacitance with "NC" pads unconnected. Case parasitic capacitance is approximately 0.05 pF. Transducer parallel capacitance can by calculated as: $C_P \approx C_O$ 0.05 pF.
- 10. Tape and Reel Standard Per ANSI / EIA 481.

Electrical Connections

The SAW resonator is bidirectional and may be installed with either orientation. The two terminals are interchangeable and unnumbered. The callout NC indicates no internal connection. The NC pads assist with mechanical positioning and stability. External grounding of the NC pads is recommended to help reduce parasitic capacitance in the circuit.

| Pin | Connection | | | |
|-----|------------|--|--|--|
| 1 | NC | | | |
| 2 | Terminal | | | |
| 3 | NC | | | |
| 4 | NC | | | |
| 5 | Terminal | | | |
| 6 | NC | | | |
