Type1LV Application Note

Introduction

This Application Note targets HW developers.

It provides how to design the Schematic and Layout, and reference RF performance

For Module specification refer to "type1lv_datasheet-*"

Document Number:	E2B-87-1029

TABLE OF CONTENTS

1   Module introduction

1.1   Type1LV Introduction

- WLAN(11a/b/g/n/ac-friendly*1)+BT/BLE(BT5.0) combo SIP module with Cypress CYW43012

- The package type is LGA(SM type)

- This module is covered with resin molding and fully shielded with metal

- MAC and BD address are embedded in OTP

*1: IEEE 802.11ac full-compliance requires support for 40 MHz and 80 MHz channel bandwidths. CYW43012 only supports 20 MHz channel bandwidth however it supports 802.11ac's 256-QAM for the 20 MHz channels in the 5GHz band enabling it to offer higher throughput and lower energy per bit than 802.11n only products.

1.2   Block Diagram

Figure-1 shows module internal block diagram.

1.3   Reference Circuit

Figure-2 shows the reference circuit of Type1LV module.

Figure-2, Reference Circuit

1) Antenna condition for Murata Radio certification

Please add attenuator circuit between Type1LV and antenna matching if you use Murata Radio certification. If your antenna peak gain is higher than Murata application one, please reduce antenna gain by this pi-type attenuator.

Please refer to "Type1LV_Antenna_performance.pdf" about more detail.

2) External 32.768kHz Sleep Clock Specifications
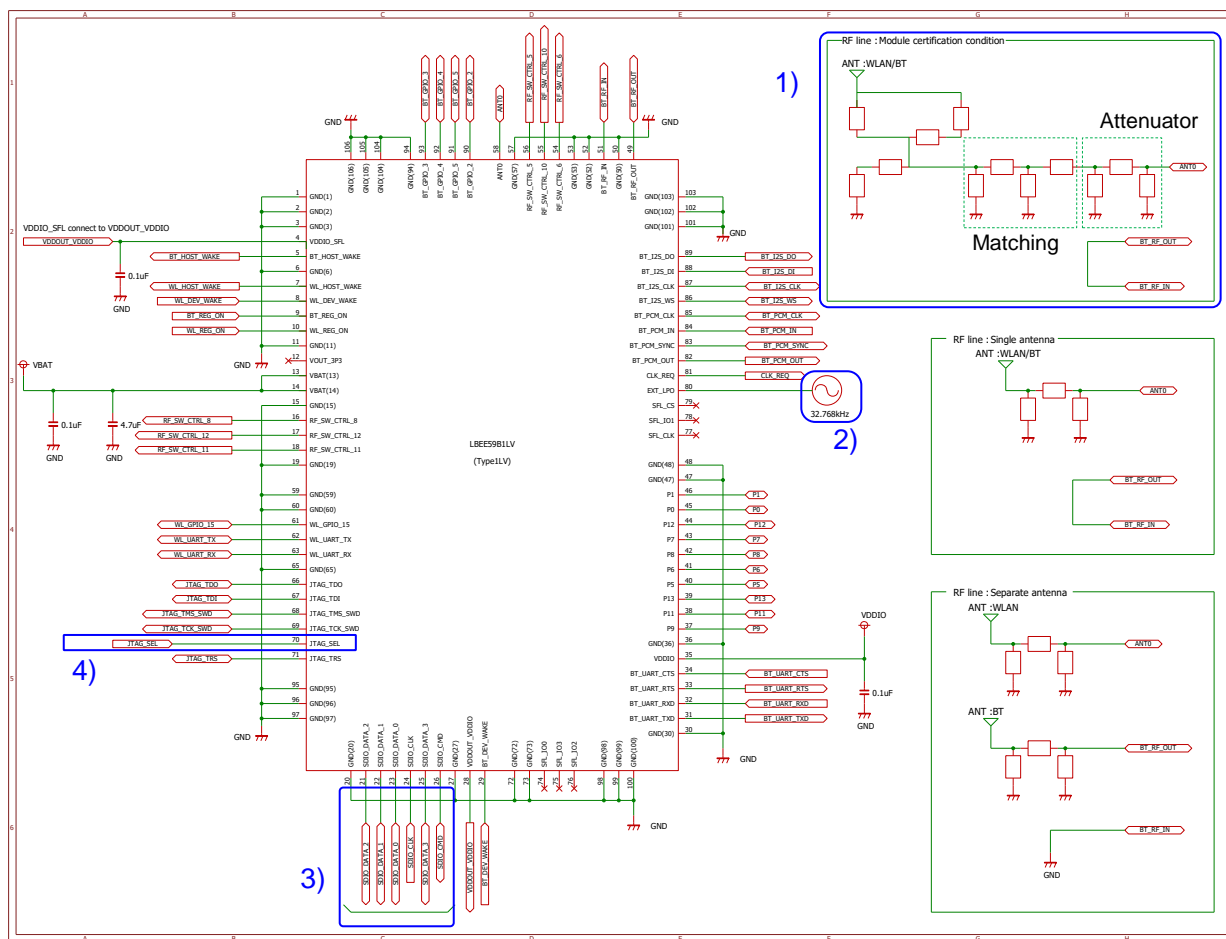

Table-1 shows External 32.768 kHz Low-Power Oscillator characteristics for Type1LV.
An external LPO is required.

Table-1, External 32.768kHz Sleep Clock Specifications

Parameter	External LPO Clock	Unit
Nominal input frequency	32.768	kHz
Frequency accuracy	+/-250	ppm
Duty cycle	30-70	%
Input signal amplitude	500 – 1800	mVp-p
Signal type	Square-wave or sine-wave	-
Input impedance*a)	> 100k	ohm

*a) When power is applied or switch off

3) SDIO

Please arrange SDIO lines with 50ohm and put siries-R, shunt-C parts to reject the noise if needed.
10k~100k ohm pull-ups are required on the four DATA lines and the COMD line. This requirement
must be met duting all operating states by using external pull-ups. This module doesn not have
internal pull-ups on these lines. Please confirm the performance on your board.

4) JTAG select

Enable: 10kohm PU
Disable: 10kohm PD

5) Guideline for unused pins

All I/O are not needed pull up/down for termination when you don't use below I/O.

2   HW Design Guideline

2.1   Underneath of module
1) Please refer to Murata Datasheet regarding to Dimensions.

   *Murata is preparing DXF file that is module footprint. "Type1LV_footprint.dxf"

2) Via design between outside and inside module pad

   Via Hole Φ250um

   Via Land Φ400um

2.2 Antenna

Antenna line should be 50ohm (*). There should be enough GND via along with Antenna line. Make sure that pi matching circuit is located right before the wifi antenna on the main board.
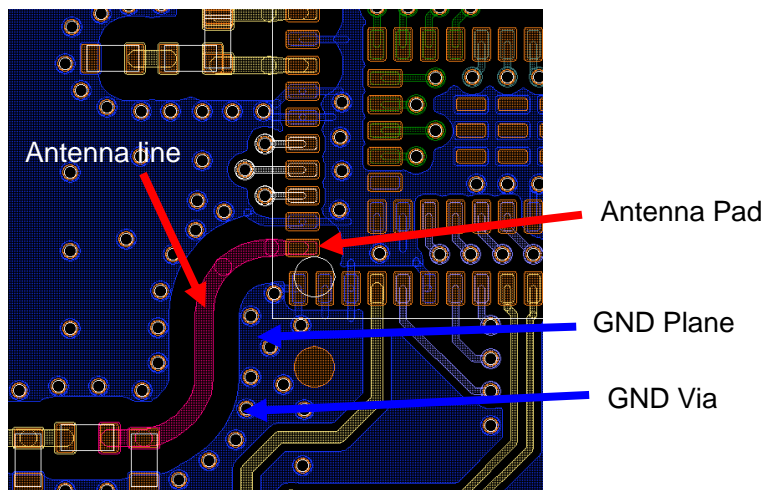

(*) How to make 50ohm line?

http://www17.plala.or.jp/i-lab/index_e.htm

Here are the conditions of 50ohm lines of evaluation board. (One of example)

- Epsilon : 4.3
- RF trace width(s) : 0.35mm
- GND gap(h) : 0.18mm
- GND gap(w) : 0.5mm

The line impedance is Z0 = **51.8ohm**.

3. RF Measurement Result

3.1 Tx output power level (at module antenna port)

3.1.1. WiFi

Tx output power setting is defined by Murata nvram file.
